Overview

Fast and accurate information drives today's businesses—manually transferring unstructured data into electronic formats is no longer a cost-effective option.

ReportMiner liberates business data trapped in printed documents such as reports, bank statements, and invoices in popular formats such as PDF, PRN, TXT, XLS, and XLSX. That electronic data can then be integrated into company databases and leveraged for operations and business intelligence applications. ReportMiner saves significant human resource time and dollars in terms of manual data entry and frees up those resources for more important tasks.

With ReportMiner's flexible and intuitive visual interface, users with little or no technical background can easily accomplish a wide range of data extraction tasks without employing expensive IT resources. ReportMiner makes data extraction so easy anyone who can use Microsoft Office software can perform sophisticated data extraction processes in a snap.

Using a sample document, a report model is visually defined. This model identifies regions and fields within the document and their interrelationships. The user friendly, drag-and-drop interface lets users quickly and easily view documents and define regions and fields, enabling them to build an extraction model in minutes.

The Auto Create feature instantly identifies all the fields in a region and determines their data types and sizes. The hierarchical model feature extracts data from complex reports in a single pass. Single-click Preview verifies and tests report models as they are being built and highlights extracted data, as well as any conversion or validation errors. Report models can be saved for reuse over and over again.

Using Astera's industry-leading data mapping capabilities, data can be mapped and exported to any destination or format. Reports can also be used as a source object in a dataflow, where users can take advantage of the advanced transformations and conversion features of ReportMiner.

Key Features

- Intuitive user interface
- Extract data from popular formats such as PDF, PRN, TXT, XLS, and XLSX
- Export data to databases like SQL Server, Access, MySQL, PostgreSQL, and any ODBC-compatible database, as well as formats such as fixed length, delimited, Excel, and XML
- Map extracted data to a dataflow for data integration and management processes
- Hierarchical data extraction
- Single-click preview
- Data mapping and export to any supported destination and format
- Extraction models can be saved and used over and over again for subsequent conversions, saving even more time
- Performance: multi-core and multiprocessor hardware mine and deliver data quickly and efficiently

Intuitive User Interface

A WYSISYG user interface enables users to view the document and define regions and fields. As these areas are defined, ReportMiner highlights all occurrences of the regions and fields. The Auto-Create field capability instantly identifies all the fields in a region and determines their data types and sizes. This capability enables users to define and verify a report model in minutes.

Figure 1. ReportMiner's intuitive interface enables users to view the document and define regions and fields.

Easy-To-Build Model

Alternatively, the easy-to-use interface enables users to manually add a field by simply highlighting the field in the object with the mouse cursor, right-clicking it, and selecting Add Field. A new field is added to the Report Browser and the Report Definition Editor shows all the occurrences of this field in the report.

Figure 2. Users can manually add a field by simply highlighting the field in the object and selecting Add Field.

Hierarchical Data Extraction

Data extraction can be done from complex hierarchical reports in a single pass using the hierarchical model capability of ReportMiner. For example, a data region can have child data regions and the child regions can have their own children and so on.

Single-Click Preview

Single-click preview capability verifies and tests the report model as it is being built. This preview shows extracted data and any conversion or validation errors.

Figure 4. The single-click preview verifies and tests the report model as it is being built.

Re-Use Extraction Models

Extraction models can be saved and used over and over again for subsequent conversions, saving even more time.

Data Mapping and Export

ReportMiner enables data mapping and export to a plethora of destinations and formats of choice. Supported destinations include databases like SQL Sever, Access, MySQL, PostgreSQL, and any ODBC compatible database; file formats such as fixed length, delimited, Excel, and XML. You can also use your report as a source object in a dataflow, where you can take advantage of the advanced transformations and conversion features of ReportMiner.

Performance

ReportMiner is designed to efficiently process large data volumes. Built from the ground up as a high-performance parallel-processing engine, ReportMiner takes full advantage of today's multi-core and multiprocessor hardware to mine and deliver your data quickly and efficiently.

ReportMiner Benefits

Complete Data Integration

Leverage extracted data using Astera's Centerprise Data Integrator for a number of complex, hierarchical data integration and management processes.

Reusability

Visually define a report model and save it to use over and over again.

Test and Verification

The single-click preview capability shows extracted data and any conversion or validation errors, enabling users to verify and test report models as they are being built.

Hierarchical Model Capability

Extract data from complex hierarchical reports in a single pass using ReportMiner's hierarchical model capability.

Easy to Use

Drag-and-drop, code-free environment enables business users to accomplish a wide range of data extraction tasks without IT support.

High Performance

High-performance parallel-processing engine efficiently processes large data volumes.
